Connection Dialog

The connection dialog allows the user to connect to a robot and selecting the connection mode (Wi-Fi, Etherne, etc.).

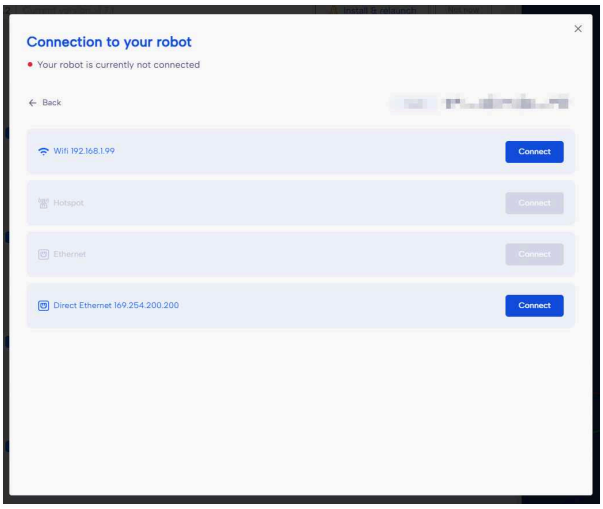

Each robot broadcasts a message via UDP (0.0.0.0 on port 2016). NiryoStudio lists all robots broadcasting on that port and displays them. The connection mode enable for each robot is also shown.

> If your robot's software version is **lower than 5.3.0**, NiryoStudio may not work correctly. A software update for the robot is required.

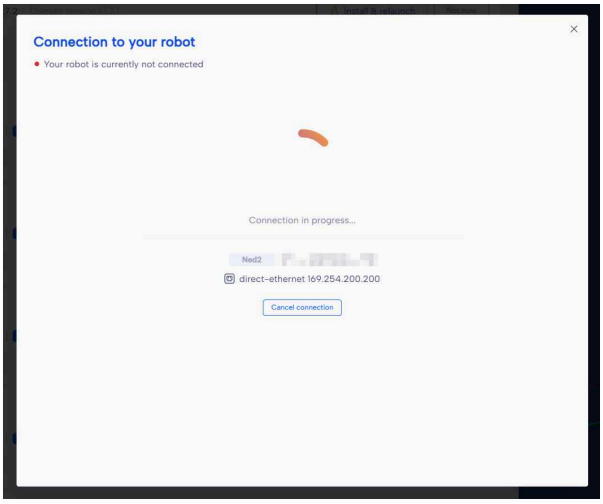

> If you know the IP address of your robot, you can connect using the manual IP option.

Select an entry from the list. NiryoStudio will display the connection mode of the selected robot. Click on **Connect**

Wait for the connection process to complete; the duration depends on the quality of your network.

Once the connection is complete, a notification will appear, and the connection status will turn green. You are now connected to the robot.
